

Send to ERP

File an email and its attachments straight onto an ERP record, from inside Outlook, in a few clicks.

Production environment

Sign-in: Microsoft 365

Version 1.0.4

Updated 24 Jun 2026

The old way meant downloading attachments and re-uploading them, and dragging emails from Outlook never worked reliably. **Send to ERP** replaces all of that with a single button: pick what to keep, choose the record, done.

1. What it does

From an open email you choose what to keep (the message itself and/or individual attachments), optionally add a short note, search for the record to file it against, and click **Attach to ERP**. The result:

- The **email** is saved to the record's *timeline* (as a Communication).
- Each chosen **attachment** is saved as a *File* on the record.
- Any **note** you add is posted as a timeline comment on the record.

You can file against any of these record types:

CONTACT

PROJECT

PURCHASE ORDER

SUPPLIER

SALES INVOICE

PURCHASE INVOICE

Or choose **Task / To-Do**: instead of an existing record, pick a person and a new task is created for them, with the email filed against it (and your note becomes the task's description).

You only ever see records you already have permission to open in ERP.

The panel: choose what to file, then find the record.

2. Quick start: install it (admin, one-time)

Installation is done once by a Microsoft 365 administrator, in two parts.

BEFORE YOU START

Replace `<your-erp-host>` below with your live ERP site's hostname, and use your own Azure app registration (its client ID is in the add-in manifest, under `WebApplicationInfo`).

Part A: Azure (one-time)

The add-in signs people in with Microsoft 365, so Microsoft needs to know the allowed return addresses.

1. Azure portal → **Microsoft Entra ID** → **App registrations**.
2. Open the add-in's **app registration** (the one whose client ID is in the add-in manifest).

3. Left menu → **Authentication**.

4. Under the **Single-page application** platform, ensure these three redirect URIs exist, then **Save**:

- `brk-multihub://<your-erp-host>`
- `https://<your-erp-host>/assets/m365email/sendtoerp/taskpane.html`
- `https://<your-erp-host>/assets/m365email/sendtoerp/dialog.html`

Part B: Upload the add-in

1. Download the package: `https://<your-erp-host>/assets/m365email/sendtoerp/sendtoerp-prod.zip`
2. Microsoft 365 admin centre → **Settings** → **Integrated apps**.
3. **Upload custom apps** (first time), or open **"Send to ERP"** → **Update file** (to deploy a new version).
4. Select the `.zip`, choose who gets it (**Just me** for a pilot, or specific groups / everyone), accept and finish.

TIP: AVOID "UPLOAD FAILED"

The server caches files for a long time, so a previously-downloaded copy can be stale. If an upload is rejected with "check the manifest", re-download with a cache-buster, add `?v=` and any number, e.g. `.../sendtoerp-prod.zip?v=103`, and upload that fresh file.

GIVE IT TIME

The button can take minutes (occasionally hours) to appear, the **desktop** app is slowest, the **web** client fastest. Have users fully quit and reopen Outlook once it's deployed.

3. How to use it

1

Open the email & the panel

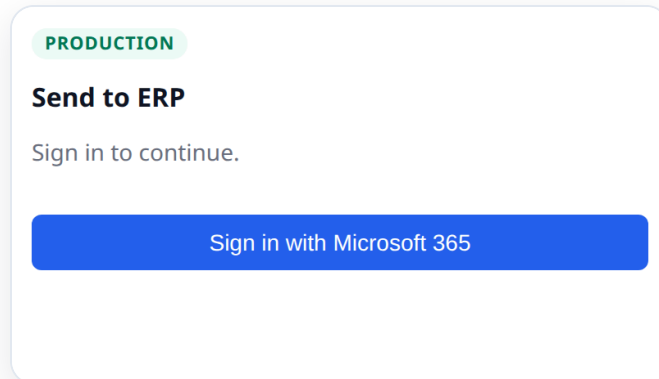

Open the email you want to file. Find **Send to ERP** on the Outlook ribbon or under the **⋮** (More actions) menu. A panel opens on the right.

2

Check the badge, then sign in

At the top of the panel, confirm the tag reads **PRODUCTION**, the live system. If you see **STAGING** (the test system), close it and use the other **Send to ERP** button.

Sign in with **Microsoft 365**, automatic on desktop; on the web a small sign-in window pops up. No ERP password is needed.

The sign-in screen, note the green **PRODUCTION** badge.

3

Choose what to file

Under **What to file**, tick **The email itself** and/or any attachments you want to keep. You can also type a short **note** in the comment box; it is posted as a timeline comment (or becomes the description when you create a Task/To-Do).

4

Choose where to file it

Under **Where to file it**, pick a **Type**, then start typing in **Find record**. Click the record you want. For contacts, the email address shows beneath the name, so two people with the same name are easy to tell apart.

To create a task instead, choose **Task / To-Do** as the Type and pick the **person** to assign it to. A new task is created for them and the email is filed against it.

Confirmation after filing.

4. How it works (for the curious / IT)

The panel

A small web page served by ERP itself, same-origin with your data, no separate web server.

Sign-in

Uses your Microsoft 365 identity. Desktop gets a token silently; the web opens a separate sign-in window. ERP verifies the token and maps it to your user.

Permissions

Normal ERP permissions apply, you can only file against records you're allowed to edit.

Where it lives

The `m365email` app: panel in `public/sendtoerp/`, API in `send_to_erp.py`, sign-in check in `addin_sso.py`.

5. Troubleshooting

Symptom	Likely cause	Fix
Button doesn't appear in Outlook	Deployment still propagating; desktop is slow	Wait, then fully quit & reopen Outlook. Admin: check it shows OK in Integrated apps.
Two "Send to ERP" buttons, or it filed somewhere you can't find	You used the Staging one	Use the button whose badge says PRODUCTION .
"Couldn't sign in" on the web; no sign-in window	Dialog redirect missing in Azure	Admin: add <code>.../dialog.html</code> under Single-page application (Part A).
"Elevated permission is required... body.getAsync"	Old add-in version	Admin: update to package v1.0.4 or later.
Admin "upload failed / check the manifest"	A stale cached <code>.zip</code> was uploaded	Re-download with a <code>?v=</code> cache-buster and upload the fresh file.
"Your Microsoft account isn't linked to an ERP user"	Your Microsoft email doesn't match an enabled ERP user	Admin: ensure the user exists and is enabled in ERP with the same email.

6. Status & limitations

- **Pilot:** currently deployed to a limited group for testing before a wider rollout.
- **Outlook for Mac (desktop):** working.
- **Outlook on the web:** working (sign-in via the dialog window).

- **Outlook for Windows (desktop):** not yet tested.
- **For IT, before full rollout:** set production's web server to not cache the add-in files, so updates reach users immediately (and the `?v=` workaround is no longer needed).

Send to ERP: Outlook add-in, part of the `m365email` app. Questions or issues: contact your ERP administrator.
